

Ochorus — Language Admin Manual

Your guide to running a language on Ochorus

Welcome, and thank you. As a **Language Admin** you are the native-speaker conscience of one (or a few) of Ochorus's languages. Your work is quality: making sure the classics read faithfully and beautifully for the readers who share your tongue. This short manual explains what you can do, what is handled by the site owner, and how your decisions reach readers.

What a Language Admin is

Ochorus has two kinds of administrator. The **Super Admin** (the site owner) runs the platform end to end. A **Language Admin** is granted access to the admin console to look after the content in their language(s). You see the same console, trimmed to the work that is yours.

Your dashboard

Signing in and opening **Language Admin** from the account menu takes you to your dashboard — a snapshot of the library: how much exists in each language, what has been added recently, and what needs attention (unreviewed translations, empty chapters, and the like). It is where each day's work starts.

Your core work: review & approve

AI-assisted translations arrive marked **unreviewed**. They are never shown to readers as finished until a native speaker has checked them — that is you. In the **Review queue** you read a translation against its English source, verse by verse where Scripture is quoted, and record a decision:

- **Approve** — the translation reads faithfully and well; it is promoted to reviewed.
- **Needs work** — note what is wrong so it can be revised.

Approving a translation is the single most valuable thing you do on Ochorus. Take the time it deserves.

The coverage matrix (read-only)

The **Coverage matrix** shows every work against every language — where each is translated and where the gaps are. As a Language Admin you can read it freely to understand your language's coverage and see what has been queued for translation. **Choosing what to queue for translation is reserved to the Super Admin**, who curates the pipeline for the whole library; you will see queued and in-progress items, but the queueing controls themselves are not shown to you.

What is reserved to the Super Admin

A few levers are deliberately kept with the site owner. This is not a limitation on your judgement — it

keeps the global, hard-to-reverse decisions in one pair of hands. As a Language Admin you do **not**:

- **Queue translation work** — from the dashboard, the coverage matrix, or a language's page. The Super Admin decides what enters the pipeline; you review what comes out of it.
- **Import documents** — uploading a Word or PDF file to create a new book or sermon is a Super Admin task.
- **See reader email addresses in full** — reader emails are personal information and are shown to you masked.
- **Administer languages** — creating a language, editing its settings or readiness thresholds, and taking it live stay with the Super Admin.
- **Manage team access** — inviting or removing admins.

How your changes reach readers

Ochorus's reader site is pre-rendered for speed, so content goes live when the site is rebuilt after a change — not the instant you click. An approval is recorded straight away; the reader-facing update follows with the next build. Approvals and edits are not lost in the meantime, so there is no need to redo them.

Good to know

- Every action in the admin console is logged to the Activity record — who did what, and when. This protects everyone.
- The admin console is English-only, even though the content you steward is not.
- If a control you expect is missing, it is almost certainly one of the Super-Admin-only levers above — ask the site owner rather than assuming a bug.
